5.9L Cummins® PCM Remanufacturing Program

In vehicles powered by a 5.9L Cummins® engine, the Engine Control Module is primarily responsible for engine function. The Powertrain Control Module is responsible for the control of non-engine systems impacting drivability. Flight Diesel has expanded our current aftermarket offering to include the remanufacturing program for Powertrain Control Modules for 5.9L Cummins® powered vehicles. Flight Diesel is remanufacturing specific hardware configurations used in vehicles from 1991 to 2003. This hardware must have the software flashed to your specific vehicle application by Flight Diesel or using your own reflashing capability.

- R&R Program for your core is always available and exchange units available on select hardware configurations - Contact your sales representative for availability
- Current coverage includes 22 part numbers with software flashes for specific vehicle configurations and trim level
- Quick ship program available for customers without in-house PCM flashing capability
- Please provide vehicle VIN, mileage, and software code from customer's PCM when ordering
- Remanufactured to OE quality level
- All modules are tri-temperature tested using automated test equipment
- 100% resolder of critical components for long product life
